## INTRODUCTION

The results of a name search in GRANDMA will be affected by spelling variations for both given names and surnames in the database. Spelling variations become increasingly common as one moves back in time, and users cannot be certain that they know the precise way in which a specific name has been entered into the database. To overcome this problem, we have created a "Name Code" consisting of 3 numbers and 2 letters. Each surname has been assigned a 3-digit code (e.g., 036 for Klassen and all its variant spellings), and each given name has been assigned a 2-letter code (e.g., ma for Mary, Maria, Marie, etc.). By typing this code, preceded by a forward slash (/), you can be assured of finding all variant spellings of any surname or given name in the database. It is very important that you become familiar with this name code system, since it will vastly improve the results of your searches.

While the surname code is generally used to combine variant spellings of the same name, it is also sometimes used to link separate surnames that are easily confused with each other.

The following lists show all surname and given name codes that have been created for the GRANDMA project.
